Digital Notebook - An Image Annotation Tool by The Scientist Magazine (A: IDAutomation's Image annotation Software for Windows. A: Have you tried InformationLabs Image Annotator? Q: Separate Netty ByteBufs - for each producer I'm using netty for something in the background, and I've discovered that because I'm using ByteBufs in my buffer, I have to keep the buffer a single ByteBuf. Is it possible to return an object to a message, and have it receive that as a byte[] for each producer? I have a following function: `public Message startMessage(byte[] content){ // Do some stuff to build a message return message; }` I need to be able to put this to the client. The issue is that I don't know how to send byte[] as a netty message. I'd have to create a Buffer in `ByteBuf.writeBytes()`, but that would make it so that I have to make sure the message can be separated into the ByteBufs that make up the message. A: If you want your byte array as a ByteBuffer that you can manipulate/access, you can just make the function return a buffer. Like so: `public Message startMessage(byte[] content){ // Do some stuff to build a message return ByteBuffer.wrap(content); }` As a side note, you really should be using `channelRead` method, rather than the built-in `writeBytes`. Here's why: When you're using a single buffer, the buffer has to be flushed and reset each time the producer adds a message to it. However, when you're using `channelRead` you can just point to the ByteBuffer in the `channelRead` method and you won't have to do any memory management for it. But to answer your question, you can separate the ByteBuffers. You do have to make sure the buffer size is greater than the message size, and that the ByteBuffers are reset. (Don't forget to re-inflate them, too!) `ByteBuf buffer1 =...; ByteBuf buffer2 =...;`
